

Keith Walker
ITAI 1371 – Midterm Project
AI Usage Disclosure

AI Usage Disclosure

AI tools were used during this project to assist with code debugging, organization, and writing support. The primary AI tool used was ChatGPT.

ChatGPT was used to help:

- troubleshoot errors in Google Colab and Python
- identify and fix issues with the dataset and preprocessing steps
- help organize the Jupyter Notebook into a clear structure
- help revise sections of the report

The specific areas that were AI-assisted included:

- removing non-numeric columns and handling missing values
- testing the Logistic Regression, Decision Tree, Random Forest, and KNN models
- organizing the final notebook and supplementary materials

All code and written content generated with AI assistance was reviewed, tested, and modified by me. I made the final decisions about which dataset to use, which models to compare, how to interpret the results, and what conclusions to include in the project. I understand the code and methods used in this project and can explain how the final model works.
