Dataset Description:  
This dataset contains song information and audio features from a combined music dataset using Million Song Dataset, Spotify, and Last.fm data. The file used for this project includes song titles, artists, year, duration, danceability, energy, loudness, acousticness, instrumentalness, liveness, valence, tempo, and time signature.

Note:  
The Music Info.csv file was used for this final project to build a simple AI DJ recommendation system. The dataset did not include real user like/dislike behavior, so a simulated “liked” column was created using song features such as energy, danceability, and valence. The cleaned dataset was used to train and compare machine learning models.
